Peptide Perspectives™

# THE BONE HEALTH STACK

## Peptide Therapies, Essential Nutrients & the Science of Skeletal Strength

**OSTEOBLASTS (Build Bone)**
Form new bone matrix (e.g., type I collagen) and drive mineralization.

**OSTEOCLASTS (Resorb Bone)**
Break down old bone, releasing minerals and helping renew bone tissue.

## KEY PATHWAYS IN BONE STRENGTH

### OSTEOBLAST / OSTEOCLAST BALANCE

- Bone is constantly broken down and rebuilt.

### PTH / PTHrP SIGNALING

- Intermittent anabolic signaling can favor bone formation.

### COLLAGEN & MINERALIZATION

- Type I collagen, calcium, vitamin D, and vitamin C support the bone matrix.

### MECHANICAL LOADING

- Resistance training and weight-bearing activity help bones stay strong.

## BONE-HEALTH STACKS & DOSING CONTEXT

### EVIDENCE-BASED ANABOLIC PATHWAY

*Teriparatide OR Abaloparatide + nutritional support*

- **Teriparatide:** 20 mcg daily (approved clinical dose)
- **Abaloparatide:** 80 mcg daily (approved clinical dose)
- **Do NOT** stack together — alternative prescription therapies
- Best human evidence for BMD gain and fracture-risk reduction.

### BPC-157 + GHK-Cu

- **BPC-157:** 250–500 mcg daily (community reports)
- **GHK-Cu:** 1–2 mg daily (community reports)
- Experimental connective-tissue / bone-healing hypothesis
- No controlled human bone-density or fracture trial.

### BPC-157 + FULL-LENGTH Tβ4

- **BPC-157:** 250–500 mcg daily (community reports)
- **Tβ4:** 1.5–2.5 mg twice weekly OR 2–5 mg 1–2× weekly (community reports)
- Fracture-remodeling hypothesis
- Full-length Tβ4 is NOT automatically the same as TB-500 fragments.

### CJC-1295 + IPAMORELIN

- **CJC-1295 (no DAC):** 100 mcg at bedtime
- **Ipamorelin:** 100–300 mcg at bedtime
- Optional second fasted morning / post-workout pulse in community protocols
- GH / IGF-1 signaling ≠ proven bone building.

**⚠ COMMUNITY DOSES ARE ANECDOTAL, NOT ESTABLISHED SAFE OR EFFECTIVE BONE-HEALTH REGIMENS.**

## SUPPORTIVE NUTRITION & TRAINING

- **Protein:** often ~1.2–1.6 g/kg/day in older adults or recovery contexts
- **Collagen peptides:** 10–15 g/day in selected studies
- **Vitamin C:** ~250–500 mg/day supports collagen synthesis
- **Calcium:** adequacy matters more than megadoses
- **Vitamin D3:** correct deficiency; dose should reflect labs and clinical guidance
- **Vitamin K2 & magnesium:** supportive when appropriate, not fracture-proven therapies
- **Resistance** training, balance work, and fall prevention are foundational.

## WHAT GOOD BONE-HEALTH TRIALS MUST MEASURE

- Bone mineral density (DXA)
- Fracture reduction
- Bone quality / microarchitecture
- Strength, balance, and fall risk
- Long-term safety

## RESEARCH STATUS

**Teriparatide / abaloparatide:** strongest human evidence

**BPC-157 + GHK-Cu:** preclinical / extrapolated

**BPC-157 + Tβ4:** promising animal fracture-healing signal, no human combination trial

**CJC-1295 + ipamorelin:** hormone changes do not prove stronger bones

**⚠ BONE-DENSITY GAINS, FRACTURE HEALING, AND FRACTURE PREVENTION ARE DIFFERENT OUTCOMES. NO COMMUNITY PEPTIDE STACK HERE HAS PROVEN HUMAN OSTEOPOROSIS OR FRACTURE-PREVENTION BENEFIT.**
