Peptide Perspectives

The New Frontier of Fat Loss

How peptides are changing weight management

From gut-brain signaling to next-generation metabolic therapies, peptide research is reshaping how scientists think about appetite, body weight, and long-term metabolic health.

WHY FAT-LOSS RESEARCH MATTERS

- Excess body fat, especially visceral fat, is linked to insulin resistance, type 2 diabetes, cardiovascular disease, sleep apnea, and fatty liver disease.
- Obesity is now understood as a chronic, biologically regulated condition, not just a matter of willpower.
- Researchers care about more than the scale: waist size, blood sugar, blood pressure, physical function, and preserving muscle also matter.
- The goal is sustainable metabolic health, not simply short-term weight reduction.

KEY BIOLOGICAL PATHWAYS

GLP-1

Fullness signals; supports appetite control, blood sugar regulation, and slower stomach emptying.

GIP

A second incretin pathway; helps coordinate insulin release and can amplify metabolic effects when paired with GLP-1.

Glucagon

Helps mobilize fuel and may influence energy expenditure and liver metabolism.

Amylin

Promotes satiety and helps regulate food intake.

Adipose & cellular energy pathways

Researches are exploring how fat cells store and use energy.

Takeaway: Different compounds may reduce food intake, alter fuel use, or target both.

COMPOUNDS RESEARCHERS ARE EXPLORING

Approved / strong human evidence | Investigational / emerging human evidence | Experimental / lower-certainty evidence

Semaglutide — APPROVED

- GLP-1 receptor agonist
- Established the modern GLP-1 foundation

Approx. 15% average weight reduction over 68 weeks in STEP-1.

Retatrutide — INVESTIGATIONAL

- GLP-1 + GIP + glucagon
- triple-pathway strategy

Approx. 25.0% mean weight reduction at 48 weeks in high-dose TRIUMPH-1 treatment-regimen analysis.

Cagrilintide — INVESTIGATIONAL

- Amylin analogue
- Alternative satiety pathway

Much of the excitement centers on the Cagrilintide + semaglutide combination ("CagriSema"), which showed greater weight loss in multiple trials, including in REDEFINE 1.

The results highlight the combination, not cagrilintide alone.

AOD-9604 — EXPERIMENTAL

- Modified growth-hormone fragment
- Interesting fat-metabolism concept

A major human obesity trial did not show meaningful efficacy.

Tirzepatide — APPROVED

- GIP + GLP-1 agonist
- Dual incretin approach

Approx. 20.2% average weight reduction over 72 weeks in SURMOUNT-5.

Mazdutide — INVESTIGATIONAL

- GLP-1 + glucagon agonist
- Weight, glucose, and liver metabolism interest

Human Phase 3 is advancing; approved for chronic weight management in China, not FDA-approved in the U.S..

Survodutide — INVESTIGATIONAL

- GLP-1 + glucagon agonist
- Metabolic and liver-health focus

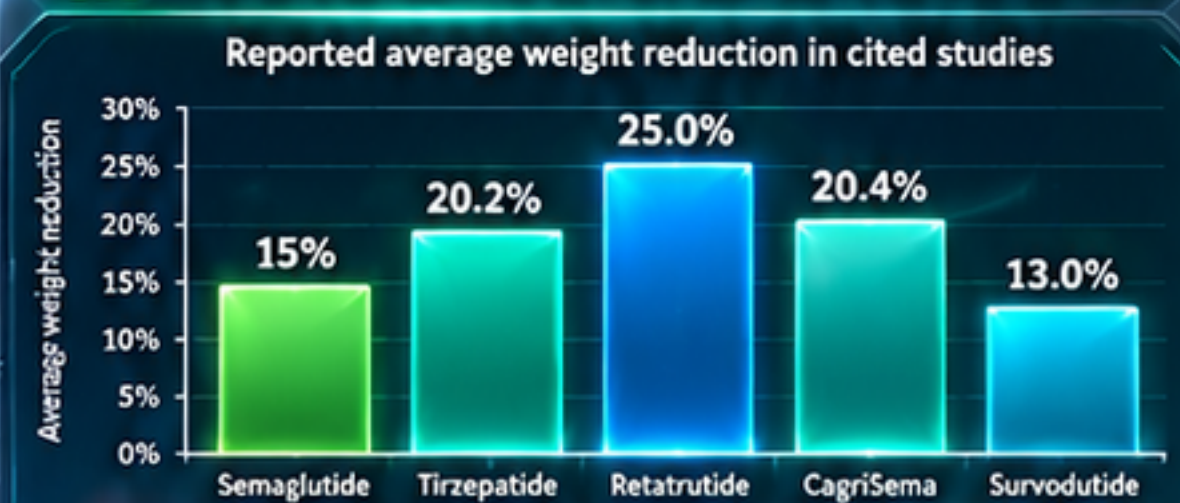
Approx. 13.0% average weight reduction at 46 weeks vs. 4.5% with placebo in SYNCHRONIZE-1.

5-Amino-1MQ — EXPERIMENTAL

- NNMT inhibitor (not a peptide)
- Cellular-metabolism strategy

Preclinical research only; no established human fat-loss efficacy or long-term safety.

REPORTED STUDY RESULTS AT A GLANCE



These percentages come from different studies with different designs and should not be treated as a direct head-to-head ranking.

WHERE THE SCIENCE IS HEADING

Multi-pathway therapies

Researchers are combining signals such as GLP-1, GIP, glucagon, and amylin.

Body composition matters

Future success is about fat loss with muscle preservation, nutrition, and physical function.

Broader metabolic benefits

Scientists are studying liver health, sleep apnea, cardiovascular risk, kidney outcomes, and glucose control.

A more personalized future

Different metabolic profiles may respond differently, so treatment may become more individualized.

EVIDENCE TAKEAWAY

- FDA approval applies only to specific drugs and indications.
- Phase 3 results are stronger than preclinical findings, but do not automatically mean a medicine is approved.
- Promising mechanisms still need rigorous human testing.
- Negative trials are important too, because they help separate theory from proven benefit.
