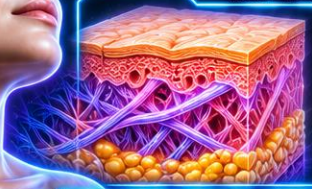
Peptide Perspectives™

THE SKIN REJUVENATION STACK

Copper Peptides, Collagen & Healthy Aging Skin

THE BIOLOGY OF SKIN AGING



Collagen & Elastin Decline
Reduced production and quality → less firmness and elasticity, more wrinkles.

Expression Lines
Repeated muscle movement and skin thinning deepen lines.

Hydration & Skin Barrier
Loss of moisture and barrier lipids (e.g., ceramides) → drier, more sensitive skin.

UV Photoaging
UV exposure drives collagen breakdown, pigment changes, and premature aging.

KEY TAKEAWAY

- True skin rejuvenation focuses on collagen support, barrier health, and damage prevention.
- Temporary plumping (e.g., hydration) can improve appearance but does not rebuild skin structure.

FOUR TOPICAL PEPTIDE STACKS (COSMETIC USE)

GHK-Cu + MATRIXYL®
(Palmitoyl Pentapeptide-4)

- Matrixyl (pal-KTTKS): 12-week randomized, split-face trial in 93 women at 3 ppm (0.003%) in a moisturizer reduced certain fine lines vs. identical base.
- GHK-Cu: Human clinical data limited; mostly preclinical and small cosmetic studies.

DOSING STATUS
No validated combination concentration or regimen.

TOPICAL FORMULATION, UNVALIDATED STACK

GHK-Cu + SNAP-8®
(Acetyl Octapeptide-3)

- SNAP-8: Research suggests it may reduce the appearance of expression lines in cosmetic formulations.
- GHK-Cu: Limited human data for topical cosmetic use.
- SNAP-8's mechanism claims are not equivalent to injected botulinum toxin.

DOSING STATUS
No verified combined concentration or regimen.

TOPICAL FORMULATION, UNVALIDATED STACK

MATRIXYL® + SYN-COLL® + SYN-AKE®

- Matrixyl (pal-KTTKS): Some clinical data (e.g., 3 ppm).
- Syn-Coll (palmitoyl tripeptide-5): Supports collagen-related signaling in cosmetic studies.
- SYN-AKE (dipeptide diaminobutyroyl benzylamide diacetate): Studied for the appearance of expression lines.
- Overlap in cosmetic signaling and limited independent studies.

DOSING STATUS
No validated triple-stack concentrations or regimen.

TOPICAL FORMULATION, UNVALIDATED STACK

GHK-Cu + PAL-GHK®

- Pal-GHK: A more stable, fat-soluble form of GHK studied for skin-conditioning and collagen-related effects.
- GHK-Cu: Limited human data for cosmetic use.
- Similar signaling pathways may be redundant when combined.

DOSING STATUS
No validated concentration or superiority vs. either ingredient.

TOPICAL FORMULATION, UNVALIDATED STACK

ADDITIONAL FORMULATION IDEAS
(UNTESTED COMBINATIONS)

- **GHK-Cu + Ceramide / Hyaluronic Acid (HA) Moisturizer**
  Supports barrier function and hydration (theoretical).
- **Matrixyl + Argireline® (Acetyl Hexapeptide-8)**
  Common cosmetic pairing for expression lines.

STUDY-BASED CONCENTRATIONS & ORAL AMOUNTS
(EXAMPLES FROM RESEARCH, NOT DOSING ADVICE)

Pal-KTTKS (Matrixyl)
3 ppm (0.003%)
in a tested facial moisturizer for 12 weeks (93 women).

Oral Hyaluronate
60 mg or 120 mg/day
for 12 weeks in a 150-adult trial (product-specific).

Oral Collagen Peptides
1 – 10 g/day
across skin trials (8–12+ weeks); results mixed and quality dependent (e.g., type, source, formulation).

OTHER KEY POINTS

- **GHK-Cu, SNAP-8, Syn-Coll, SYN-AKE, Pal-GHK:** No standard validated combination doses; concentrations vary by finished formulation.
- **SPF 30+ daily** and consistent moisturizers are better supported for preventing visible aging.
- **Vitamin C:** obtain dietary sufficiency (important for collagen support).
- **Ceramides:** formulation-dependent (helps barrier and moisture).
- **Omega-3s:** supports overall skin health (e.g., hydration, inflammation), but no proven wrinkle reversal.

EVIDENCE HIERARCHY FOR SKIN REJUVENATION

Strongest Support	SPF 30+ daily and appropriate retinoids (e.g., tretinoin, retinol) for photoaging.
Moderate Support	Some individual ingredient studies (e.g., pal-KTTKS); hydration supplements (e.g., oral hyaluronate).
Limited Support	Preclinical data and small cosmetic studies (e.g., GHK-Cu, SNAP-8, Syn-Coll, SYN-AKE, Pal-GHK).
Least Support	Little convincing, direct synergy trials for peptide mixtures (stacks).

KEY CLINICAL TEST DESIGN

To prove a stack works, a controlled trial should compare:

- Base vehicle only (no actives)
- A only (e.g., GHK-Cu)
- B only (e.g., Matrixyl)
- A + B (the stack)

Measured outcomes at 8–12 weeks (or longer):

- Wrinkle depth
- Elasticity (firmness)
- Hydration (skin moisture)
- TEWL (barrier function)
- Irritation / tolerability

SAFETY & REALISTIC EXPECTATIONS

- Formulation stability matters (e.g., copper complex stability).
- Risk of preservative or ingredient allergy (e.g., redness, irritation, rash).
- Penetration through the stratum corneum is limited and varies by peptide and formulation.
- Topical and injectable peptides are not equivalent (different delivery, concentrations, and effects).
- No proven cosmetic "stack synergy" for the combinations above.
- Expect gradual, modest changes (e.g., smoother texture, firmness, hydration), not dramatic or immediate results.

NO PEPTIDE STACK SHOWN HERE HAS A VALIDATED COMBINED COSMETIC DOSE OR PROVEN SUPERIORITY. STUDIED CONCENTRATIONS ARE NOT PERSONAL RECOMMENDATIONS.
