Peptide Perspectives™

WOLVERINE, GLOW & BEYOND

Experimental Peptide Stacks for Injury Recovery

KEY MECHANISMS IN TISSUE REPAIR & RECOVERY

Inflammation & Resolution
Helps modulate inflammatory signaling and supports the transition to healing.

Cell Migration
Supports movement of repair cells to the site of injury.

Collagen & ECM Remodeling
May influence collagen production, angiogenesis, and extracellular matrix (ECM) repair.

Strength, Function & Rehabilitation
Supports tissue remodeling, load tolerance, and return to activity.

POPULAR INJURY-RECOVERY STACKS & COMMUNITY PROTOCOLS

WOLVERINE
BPC-157 + TB-500

BPC-157
250 – 500 mcg daily
(community reports, subcutaneous)

TB-500 (Fragment)
2 – 2.5 mg twice weekly
(community reports; exact identity must be checked)

GLOW
BPC-157 + GHK-Cu + Tβ4

BPC-157
250 – 500 mcg daily
(community reports)

GHK-Cu
1 – 2 mg daily
(community reports)

Tβ4 (Full-Length)
2 – 5 mg twice weekly
(community reports)

Note: No validated mixture ratio has been established.

KLOW
BPC-157 + GHK-Cu + KPV + TB-500 or Tβ4

BPC-157
250 – 500 mcg daily
(community reports)

GHK-Cu
1 – 2 mg daily
(community reports)

KPV
200 – 500 mcg daily
(community reports)

TB-500 (Fragment) OR Tβ4 (Full-Length)
Specify the exact chemical form and use an appropriate dose for that form.

BPC-157 + KPV
Focused Repair & Inflammation Modulation

BPC-157
250 – 500 mcg daily
(community reports)

KPV
200 – 500 mcg daily
(community reports)

Note: No controlled human trials have evaluated this combination.

ALL DOSES ARE COMMUNITY REPORTS, NOT ESTABLISHED SAFE OR EFFECTIVE REGIMENS.

THYMOSIN BETA-4 (Tβ4) vs. "TB-500"

Tβ4 (Full-Length)
- 43 amino acids (Thymosin Beta-4)
- Endogeneous protein involved in cell migration, angiogenesis, and repair.
- Common community dose: 2 – 5 mg, 1 – 2× per week.

VS

"TB-500" (Fragment)
- Typically the 7-amino-acid fragment Ac-LKKTETQ.
- A synthetic fragment of Tβ4 with different properties and a longer half-life.
- Common community dose: 2 – 2.5 mg, 1 – 2× per week.

⚠ ***IMPORTANT: Tβ4 (full-length) and TB-500 (fragment) are different compounds. Their doses are NOT interchangeable.***

SUPPORTIVE NUTRITION (BETTER SUPPORTED)

Protein	Adequate daily intake, often 1.2 – 1.6 g/kg/day (individualized).
Creatine Monohydrate	3 – 5 g/day (well-studied for muscle strength and recovery).
Collagen / Gelatin	10 – 15 g/day in selected exercise studies (often with vitamin C, ~250 – 500 mg/day).
Omega-3s (EPA/DHA)	From food sources (e.g., fatty fish). Routine supplements have not been proven to accelerate tendon healing.
Vitamin C	250 – 500 mg/day (supports collagen formation).

CLINICAL PRIORITIES FOR INJURY RECOVERY

- Accurate diagnosis (e.g., imaging when needed).
- Graded physical therapy and progressive loading (the foundation of tissue recovery).
- Quality sleep (aim for 7 – 9 hours per night).
- Adequate calories and protein to support repair.
- Track functional outcomes: pain, strength, range of motion (ROM), return to activity, and reinjury risk.

RESEARCH EVIDENCE: CURRENT STATUS

- Most evidence is preclinical (cell and animal studies).
- BPC-157: very low-certainty human research (small studies, limited scope).
- No controlled human musculoskeletal outcome trials for finished stacks (Wolverine, GLOW, KLOW, etc.).
- Larger, well-designed human trials are needed to determine safety, dosing, and real-world effectiveness.

⚠ NO STACK HAS PROVEN HUMAN INJURY-HEALING BENEFIT. ANECDOTAL COMMUNITY AMOUNTS ARE NOT SAFE DOSING PROTOCOLS.
